

tycostream positioning

How to talk about tycostream

Framework

The positioning framework has 6 parts

01

1. Functional description

What is the product, who is it for, and what does it do

02

2. Problem framing

The core challenge the product solves

03

3. Value framing

The outcome and benefit the product delivers

04

4. Supporting argument 1

First proof point with features

05

5. Supporting argument 2

Second proof point with features

06

6. Supporting argument 3

Third proof point with features

Anchors

Each part uses anchors to make the message concrete and specific

- **Category** anchors what kind of product it is
- **Persona** anchors who uses it
- **Use Case** anchors the business scenario or job to be done
- **Alternative** anchors what's broken about the status quo
- **Feature** anchors what capabilities enable that
- **Value** anchors the business outcome

1. Functional Description

What is the product, who is it for, and what does it do

tycostream is a GraphQL server that helps backend developers build real-time APIs over their streaming database.

Category

·

Persona

·

Use Case

2. Problem Framing

The core challenge the product solves

Streaming data to UIs and AI agents requires building and managing custom WebSockets infrastructure.

Alternative

3. Value Framing

The outcome and benefit the product delivers

tycostream lets **developers** expose streaming database views as real-time APIs without any code.

Persona

·

Value

4. Supporting Argument 1

First proof point with features

Real-time Subscriptions

Unlike **custom infrastructure** where you implement last-mile filtering and WebSocket delivery yourself, tycostream provides **Hasura-style filters** and **WebSocket subscriptions** out of the box.

Value

·

Alternative

·

Feature

5. Supporting Argument 2

Second proof point with features

Event Triggers

Unlike **custom infrastructure** where you wire up event handling yourself, tycostream lets you define **trigger conditions** that fire **webhooks** when data changes.

Value

·

Alternative

·

Feature

6. Supporting Argument 3

Third proof point with features

Configuration, Not Code

Unlike **custom infrastructure** that requires writing and maintaining code, **tycostream** uses **YAML configuration** to produce **typed GraphQL APIs** automatically.

Value

·

Alternative

·
